

Learnings: Demo 9 - MLOps

- User prefers a single Agent → Ensure smooth Agent UI/UX
- Hops.ai = Tool

- ↳ Hosting of documents:
 - on premise deployment possible
 - hosted on own server as first instance
- ↳ Data availability to AI?:
 - connection side can be limited
 - Document view not limited
 - GitHub
 - Google Calendar

Demo 10 - AI workers to augment pharma

Avatia.ai

- Pharma:
 - High spending
 - Limited reach
 - Limited outcome of product outcomes, compared to commercial expect.
- } Hard to scale

- support doctors & pharmacists
 - chief Medical offices + managers
- } All target group!

- Field tactics + connect phar
- Sales rep:
 - performance → Dashboard
 - Medical & brand knowledge connected
 - Overview → execution plan
 - AI co-worker preparing etc.

Learning:

- Compact product story
 - slide 1 - Purpose / value proposition
 - slide 2 - Ecosystem / architecture
- Demos based on use cases / personas
- Show rather than explain
- Purpose in the end again

- Interaction: Voice, E-Mail & Whatsapp (channel)
- AI as „co-worker“
- Status, is it already deployed?

Demo 11 - The agent was the easy part

AirHelp → flight compensation (B2C)

→ Head of data

→ Status quo of KPI's (applied, achievements)

→ Learnings shared: 4 obstacles + advice!

- AIDA =
- Slack interface
 - PO specialist
 - Data analytic software
 - Metric assessment

} Architecture
s. picture

4 challenges:

1. Metric def. sprawl
2. Varying stakes.
3. Lack of Trust
4. culture shift

} People &
change
Mgmt

- ⇒ 1. -symantic layer → single source of truth!
- writing against pre-defined logic
- Reproducibility!

1.1. Get agreement between

⇒ Restrict access
to symantic layer

BI tool and AI
Add on
top of
semantic
layer

1.2. Refusal analysis! Make „I don't have that“
an answer + tracking refusal rate to

see what else is needed

⇒ Ensure „same“ view to generate trust in AI content & fix „refusal“

2. Focus on stakeholders that are our key target group

→ Identify metric to monitor effectiveness of agent!

What do we want AI to be used for & what upscaling is needed to achieve effectiveness

→ Ensure accessibility e.g. via using slang as establ. UI

3. Lack of trust in AI

- Enable employees / developer to explain tool so 3rd party trust it ⇒ Trust lies with people!

- Incl. quality checks!

- Tracability !

- Reproducibility

⇒ Claude sonet as model

Demo 12 → when what to build becomes the bottleneck

- Experimenta: Trafo „builder“ not consultant
→ Embedded product builder

- What changed? → Problems → Solutions

- Code not bottleneck, it's cheap
- Capacity freed up

Product Manager
is dead, it needs
only product builder

Everyone to be
a „builder“!
It comes with a
trade off & risks!

Specialized Agents
working together

- making decisions,
that should not
be delegated

1. Roles get blurred!

Data, designer,
engineer and
product mgmt
people are
lost where
role starts
& ends

2. Doing vs. judging of output & quality

⇓
Gap! lots of
actionism
but judgement
not growing
as fast

3. Approval fatigue concept

- Empower ≠ Everyone
should code

- 1) context of changes
to be ensured
+ quality cycles!

- 2) shared company
brain / system
(e.g. GitHub)

+ workspace map

provide context,
purpose etc. to
Agents

(Documentation
+ context for
agents + humans)

software engineer
only babysitting
Agents!
People stop
challenging agents
but just accept

3) Make agent
work visible
⇒
Claude code

4. AI grenades

- Lazy work = delegating tasks to agents, not challenging it + passing it on!
- Now receiver gets massive documents to review!
Review task gets bundled on individuals!

5. Speed

- Delivery quicker than what market is able to adopt/absorb
- Humans can't keep up with new features!
Product is constantly evolving!
- Avoid loops that are too short!

- Build & release cycle!
- cut freeze of 5-10 days + spend time with user to ensure adoption, Q&A + documentation!

6. Context is not a warehouse

- Data access - add it to a single brain for agents to use!
- Not helpful! It is important to exclude
